

HABITAT MANAGEMENT, CREATION AND RESTORATION

Habitat Creation

Working with and listening to our clients, senior environmental project advisors at ADK identify the best possible options, from an environmental and ecological as well as the projects view point, when scoping areas for any particular receptor, mitigation, creation, restoration or enhancements that are socially and economically sustainable.

Our advice and options take into account the topography of the proposed area, the surrounding environment, the resources available, and the aims of the client for undertaking the project in the first place. ADK listen to all parties to enable the project to run efficiently without delays to the scope of works.

ADK provide experienced environmental clerk of works, ecologists and invasive alien species specialists and other supply suitable consultants contractors via our approved Environmental Management System and approved suppliers and sub-contractors list to carry deliver a successful project. ADK have access to leading research, development and new techniques via the Lancaster Environment Centre, CEH and NERC.

Should any permissions, licenses or consents be necessary ADK can apply for these on behalf of the client and attend high level meetings with statutory consultees, stakeholders and other 3rd parties.

Habitat Management and Enhancement

ADK staff work with land managers and owners to identify both current and potential key environmental and ecological features of a given area. We then assist in programmes designed to maintain, enhance and develop the identified features. Where appropriate, we are happy to project manage all associated environmental works and supply suitable specialist contractors and consultants from our approved suppliers list to carry out a wide range of works and services.

Habitat Restoration

Site scoping surveys are undertaken with the client and any statutory consultees and stakeholders to identify and assess the key ecological and environmental features of the area being reviewed for restoration. Before the restoration programme takes place, we will ensure that, in restoring features of similar or more significant ecological or environmental value, are not being damaged or destroyed.

Clear objectives are developed and an agreed programme is then provided, indicating the specific work to be carried out, when and at what fixed cost. Should permissions be required our advisors will apply for these on behalf of the client and provide provision of Environmental Clerk of Works and Ecological Banksmen to ensure environmental best practice and compliance before, during and after any works.
